

# The tikzquads Package

## An Extension to CircuiTikZ

### Version 1.2

Alceu Frigeri\*

March 2025

#### Abstract

This package defines a few extra shapes (single / dual port boxes) designed to be used together with the *CircuiTikZ* package.

# 1 Introduction

In standard text books, Circuit Theory and Electronics alike, quite often one ends representing sub-circuits as either:

- a single port *black box*, or
- a dual port *black box*

This package defines a few, parameterized shapes for each case:

- for single port *black boxes*:
  - Black Box
  - Thevenin
  - Norton
- for dual port *black boxes*:
  - Quad
  - Quad Z
  - Quad Y
  - Quad G
  - Quad H

A *Pseudo-Graph load line* shape is also defined, for those moments where a true graph, like the ones *pgfplots* enables, isn't needed. Lastly, a convenience interconnection command is defined, `\QuadParConnect` (see 6).

## 1.1 CircuiTikZ

Unfortunately, some implementation details of this package don't follow the code structure adopted by *CircuiTikZ*, and some significant part of this package's code would have to be re-written if it were to be integrated directly in *CircuiTikZ*, and that's the main reason this is, for the time being, a separate package. After all, even though this doesn't follows *CircuiTikZ* code scheme, it does work nicely with it, as is.

# 2 Auxiliary Shapes and Basic Keys

Those shapes are not intended for end users.

## 2.1 Auxiliary shapes

A set of auxiliary shapes are defined, but not meant to be used otherwise, though their anchors might be relevant:

**Note:** The point being that, regardless of the sub-shape orientation, the intuitive geographical coordinates applies.

## 2.2 General Keys

General keys to fine tuning a shape:

<i>outer sep</i>	Text outer separation, initial value: 1.5pt
<i>inner sep</i>	Text inner separation, initial value: 1pt
<i>thickness</i>	Components thickness (relative to the drawing thickness), initial value: 2
<i>tip len</i>	tip len (current source). initial value: 4pt
<i>tip type</i>	possible values: <i>triangle</i> and <i>bezier</i> . initial value: <i>triangle</i>
<i>minussign len</i>	Minus sign len (voltage source). initial value: $\backslash\text{pgf@circ@Rlen}/14$
<i>plussign len</i>	Plus sign len (voltage source). initial value: $1.1\backslash\text{pgf@circ@Rlen}/14$
<i>source radius</i>	The base radius. initial value: $0.3\backslash\text{pgf@circ@Rlen}$
<i>round sources</i>	Sources will be round ones
<i>control sources</i>	Sources will be control/diamond ones
<i>generic, european</i>	Impedances will be generic rectangles
<i>zigzag, american</i>	Impedances will be draw as zigzags

## 3 Z, Y, G, H Quadripoles

A set of configurable Quadripoles is defined, whereas quadripoles parameters (for instance  $Z_{11}$ ,  $Z_{12}$ ,  $Z_{21}$  and  $Z_{22}$ ) are  $\langle\text{key-value}\rangle$  parameters.

### 3.1 The Base Dual Port / Quadripole Shape

The base shape just draws a base box and sets some connection anchors: 1+, 1-, *inner* 1+, *inner* 1-, 2+, 2-, *inner* 2+ and *inner* 2-, besides the geographic ones:

And also a set of (meant for) *text* anchors:

#### 3.1.1 Base Keys

These applies to all Quad shapes:

<i>base width</i>	The 'box' width
<i>half base width</i>	Ditto, half width. Initial value: $2\backslash\text{pgf@circ@Rlen}$ .
<i>base height</i>	The distance between 1+ and 1-. The 'box' full height is equal to $2*(\text{half base height} + \text{height ext} + \text{height ext+})$ .
<i>half base height</i>	Ditto, half height. Initial value: $\backslash\text{pgf@circ@Rlen}/7$
<i>height ext</i>	Initial value: $2\backslash\text{pgf@circ@Rlen}/7$
<i>height ext+</i>	Initial value: 0
<i>inner ext</i>	distance between the 'box' and inner1+/1-/2+/2-. initial value: $\backslash\text{pgf@circ@Rlen}/7$
<i>outer ext</i>	distance between the 'box' and 1+/1-/2+/2-. initial value: $5\backslash\text{pgf@circ@Rlen}/14$
<i>inner marks</i>	If set, the inner anchors will be marked.
<i>outer marks</i>	If set, the outer anchors will be marked.
<i>invert</i>	The shape will be inverted, more or less like 'x scale=-1'.
<i>alt, opt</i>	Case a Voltage source is zero, a series impedance will be draw vertically.
<i>outer x fit to</i>	For any Quad, this is the same as <i>outer x fit to*</i> .

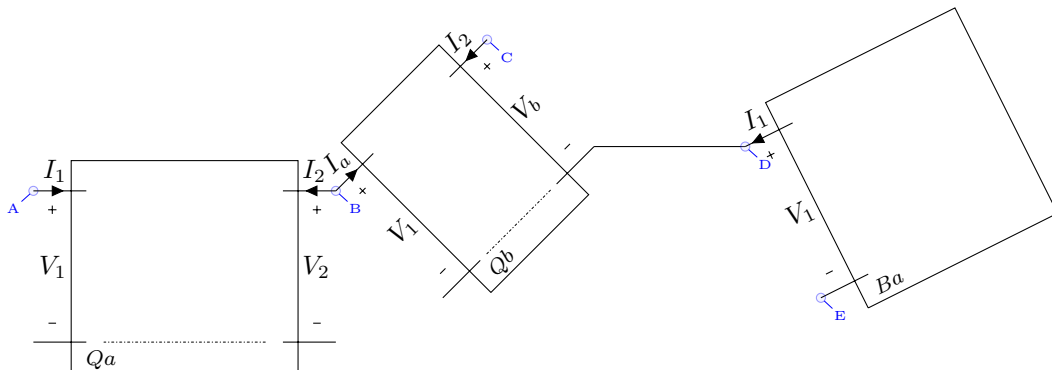

<code>outer x fit to*</code>	<code>outer x fit*={⟨CoordA⟩}{⟨CoordB⟩}</code> . The width will be set so that ⟨1+⟩ and ⟨2+⟩ (or ⟨1-⟩ and ⟨2-⟩, depending on the used anchor) <b>will fit</b> ⟨CoordA⟩ and ⟨CoordB⟩. This might result in a shape rotation.
<code>outer x fit to!</code>	<code>outer x fit!={⟨CoordA⟩}{⟨CoordB⟩}</code> . The width will be set so that the distance between ⟨1+⟩ and ⟨2+⟩ (or ⟨1-⟩ and ⟨2-⟩, depending on the used anchor) will be the same as ⟨CoordA⟩ and ⟨CoordB⟩. This will never result in a shape rotation.
<code>inner x fit to</code>	For any Quad, this is the same as <code>inner x fit to*</code> .
<code>inner x fit to*</code>	<code>inner x fit*={⟨CoordA⟩}{⟨CoordB⟩}</code> . The width will be set so that ⟨inner 1+⟩ and ⟨inner 2+⟩ (or ⟨inner 1-⟩ and ⟨inner 2-⟩, depending on the used anchor) <b>will fit</b> ⟨CoordA⟩ and ⟨CoordB⟩. This might result in a shape rotation.
<code>inner x fit to!</code>	<code>inner x fit!={⟨CoordA⟩}{⟨CoordB⟩}</code> . The width will be set so that the distance between ⟨inner 1+⟩ and ⟨inner 2+⟩ (or ⟨inner 1-⟩ and ⟨inner 2-⟩, depending on the used anchor) will be the same as ⟨CoordA⟩ and ⟨CoordB⟩. This will never result in a shape rotation.
<code>y fit to</code>	For any Quad, this is the same as <code>y fit to!</code> .
<code>y fit to*</code>	<code>y fit*={⟨CoordA⟩}{⟨CoordB⟩}</code> . The height will be set so that 1+ and 1- <b>will fit</b> CoordA and CoordB. This might result in a shape rotation
<code>y fit to!</code>	<code>y fit!={⟨CoordA⟩}{⟨CoordB⟩}</code> . The height will be set so that the distance between ⟨1+⟩ and ⟨1-⟩ will be equal to the distance between ⟨CoordA⟩ and ⟨CoordB⟩. This will never result in a shape rotation.
<code>label top left</code>	It will place a label at the top left anchor
<code>label top center</code>	It will place a label at the top center anchor
<code>label top right</code>	It will place a label at the top right anchor
<code>label inner top left</code>	It will place a label at the inner top left anchor
<code>label inner top center</code>	It will place a label at the inner top center anchor
<code>label inner top right</code>	It will place a label at the inner top right anchor
<code>label bottom left</code>	It will place a label at the bottom left anchor
<code>label bottom center</code>	It will place a label at the bottom center anchor
<code>label bottom right</code>	It will place a label at the bottom right anchor
<code>label inner bottom left</code>	It will place a label at the inner bottom left anchor
<code>label inner bottom center</code>	It will place a label at the inner bottom center anchor
<code>label inner bottom right</code>	It will place a label at the inner bottom right anchor

A small example of the *fit to* keys:

```

1 \begin{tikzpicture}
2 \draw (0,0) \pincoord(A,blue,225) ++(4,0) \pincoord(B,blue,-45) ++(2,2) \pincoord(C) ;
3
4 \draw (A) node[Quad,anchor=1+,outer x fit to={A}{B}] (Qa){\footnotesize$Qa$};
5 \draw (B) node[Quad,anchor=1+,outer x fit to={B}{C},I1=$I_a$,V2=$V_b$] (Qb){\footnotesize$Qb$};
6
7 \draw (Qb.2-) -- ++(2,0) \pincoord(D) ++(1,-2) \pincoord(E);
8
9 \draw (D) node[Black Box,anchor=1+,y fit to={D}{E}] (Ba){\footnotesize$Ba$};
10
11 \draw (Qa.1-) ++(0,-1);
12 \end{tikzpicture}

```

## 3.2 Quad

```

1 % Node use
2 node[Quad]{}
3
4 % To path use
5 (A) to[ToQuad] (B)

```

This is just the base shape, to be used in cases whereas one just want to emphasises part of a circuit (using, for instance, the *inner x fit to* key, or just mark a two port black box.

**Note:** There is also a *ToQuad* to be used in a *to[ ]* path, in which case the key *outer x fit to* style will be triggered with the starting and ending points of the *to[ ]* path.

### 3.2.1 Quad Keys

<i>name</i>	$\langle$ node-name $\rangle$ , when using a <i>to[ ]</i> path.
<i>I1</i>	Initial value: $\$I_1\$$
<i>I2</i>	Initial value: $\$I_2\$$
<i>V1</i>	Initial value: $\$V_1\$$
<i>V2</i>	Initial value: $\$V_2\$$

### 3.2.2 Examples of *fit to* use

Squeezing a Quadripole between two parts of a circuit (nodes C and D):

```

1 \begin{center}
2 \resizebox{0.5\textwidth}{!}{
3 \begin{tikzpicture}
4 \draw (0,0) \pincoord(ref) to[R=R1] ++(0,2) \pincoord(A) to[R=R2] ++(0,2) \pincoord(B)
5 -- ++(2,0) \pincoord(C,red,225) (C |- ref) \pincoord(C1,blue,135) -- (ref);
6 \draw (C) ++(7,0) \pincoord(D,red) -- ++(0.5,0) to[R=R3] ++(0,-3) -- ++(2,0) to[R=R4] ++(0,3) -- ++(0.5,0)
7 \pincoord(E);
8 \draw (C) node[Quad,anchor=1+,y fit to={C}{C1},outer x fit to={C}{D}] {};
9 \end{tikzpicture}
10 \end{center}

```

Fitting some circuit inside the Quadripole (nodes C and E):

```

1 \resizebox{0.4\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \pincoord(ref) to[R=R1] ++(0,2) \pincoord(A) to[R=R2] ++(0,2) \pincoord(B)
4 -- ++(2,0) \pincoord(C,red) (C |- ref) \pincoord(C1) -- (ref);
5 \draw (C) ++(7,0) \pincoord(D) -- ++(0.5,0) to[R=R3] ++(0,-3) -- ++(2,0) to[R=R4] ++(0,3) -- ++(0.5,0)
6 \pincoord(E,red);
7 \draw (C) node[Quad,anchor=inner 1+,y fit to={C}{C1},inner x fit to={C}{E}]{};
8 \end{tikzpicture}}

```

### 3.3 Quad Z

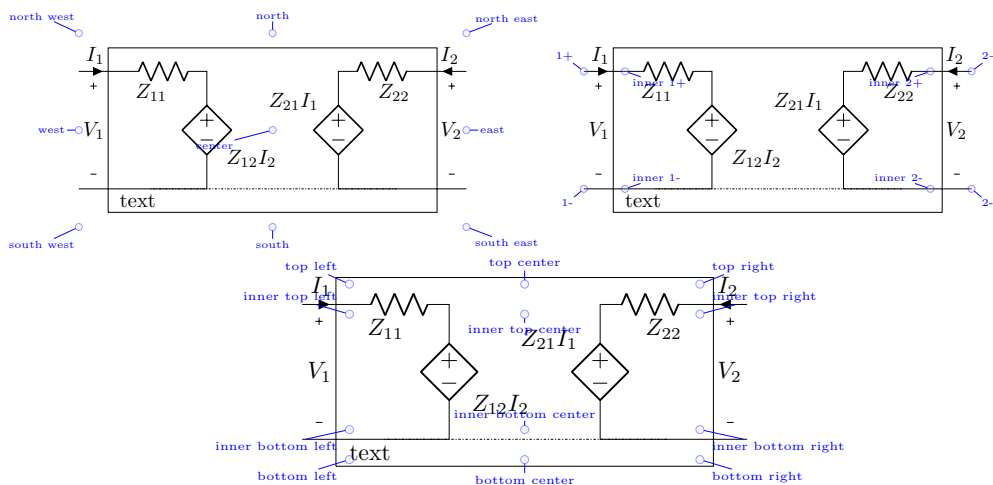

```

1 % Node use
2 node[Quad Z]{}
3
4 % To path use
5 (A) to[ToQuad Z] (B)

```

Besides the base anchors (see 3) it has 4 internal nodes: `<node>-Z11`, `<node>-Z12`, `<node>-Z21` and `<node>-Z22` and each of those sub-nodes has geographic anchors as defined at 2.1.

**Note:** There is also a `ToQuad Z` to be used in a `to[ ]` path, in which case the key `outer x fit to` style will be triggered with the starting and ending points of the `to[ ]` path.

#### 3.3.1 Quad Z keys

<i>name</i>	<code>&lt;node-name&gt;</code> , when using a <code>to[ ]</code> path.
<i>I1</i>	Initial value: $\$I_1\$$
<i>I2</i>	Initial value: $\$I_2\$$
<i>V1</i>	Initial value: $\$V_1\$$
<i>V2</i>	Initial value: $\$V_2\$$
<i>raw sources</i>	This will suppress the control variables (I1, I2) in the sources' labels
<i>Z11</i>	Initial value: $\$Z_{11}\$$
<i>Z12</i>	Initial value: $\$Z_{12}\$$
<i>Z21</i>	Initial value: $\$Z_{21}\$$
<i>Z22</i>	Initial value: $\$Z_{22}\$$
<i>Z11 label pos</i>	changes the label position. Defaults to: <code>{south west}{top left}</code>
<i>Z12 label pos</i>	changes the label position. Defaults to: <code>{south east}{top left}</code>
<i>Z21 label pos</i>	changes the label position. Defaults to: <code>{north west}{bottom right}</code>
<i>Z22 label pos</i>	changes the label position. Defaults to: <code>{south east}{top right}</code>

**Note:** The label pos keys expects two anchor names (... label pos = `{<anchor A>}{<anchor B>}`). The first anchors refers the sub-shape node and the second anchor is the text one.

### 3.4 Quad Y

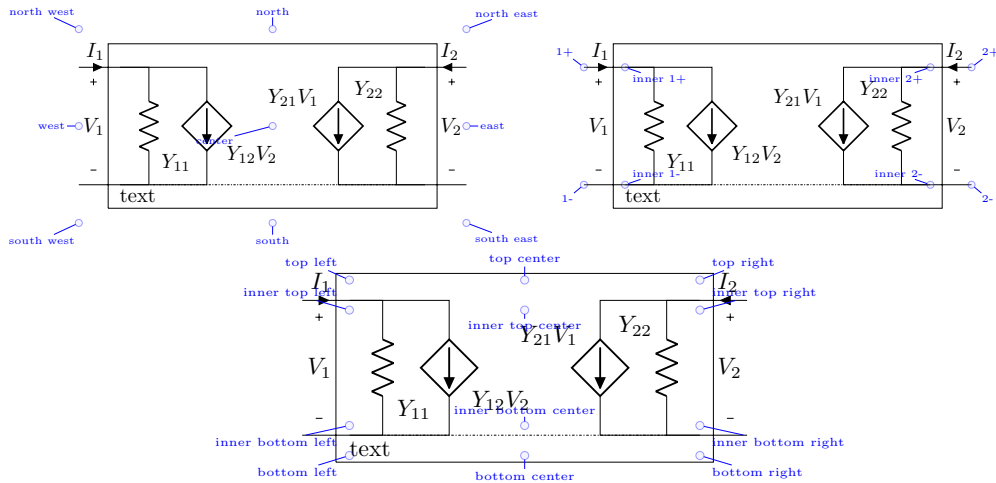

```

1 % Node use
2 node[Quad Y]{
3
4 % To path use
5 (A) to[ToQuad Y] (B)

```

Besides the base anchors (see 3) it has 4 internal nodes: `<node>-Y11`, `<node>-Y12`, `<node>-Y21` and `<node>-Y22` and each of those sub-nodes has geographic anchors as defined at 2.1.

**Note:** There is also a `ToQuad Y` to be used in a `to[ ]` path, in which case the key `outer x fit to` style will be triggered with the starting and ending points of the `to[ ]` path.

#### 3.4.1 Quad Y keys

<code>name</code>	<code>&lt;node-name&gt;</code> , when using a <code>to[ ]</code> path.
<code>I1</code>	Initial value: $\$I_1\$$
<code>I2</code>	Initial value: $\$I_2\$$
<code>V1</code>	Initial value: $\$V_1\$$
<code>V2</code>	Initial value: $\$V_2\$$
<code>raw sources</code>	This will suppress the control variables ( <code>V1</code> , <code>V2</code> ) in the sources' labels
<code>Y11</code>	Initial value: $\$Y_{11}\$$
<code>Y12</code>	Initial value: $\$Y_{12}\$$
<code>Y21</code>	Initial value: $\$Y_{21}\$$
<code>Y22</code>	Initial value: $\$Y_{22}\$$
<code>Y11 label pos</code>	changes the label position. Defaults to: <code>{south west}{top left}</code>
<code>Y12 label pos</code>	changes the label position. Defaults to: <code>{south east}{top left}</code>
<code>Y21 label pos</code>	changes the label position. Defaults to: <code>{north west}{bottom right}</code>
<code>Y22 label pos</code>	changes the label position. Defaults to: <code>{north west}{bottom right}</code>

**Note:** The label pos keys expects two anchor names (... label pos = `{<anchor A>}{<anchor B>}`). The first anchors refers the sub-shape node and the second anchor is the text one.

### 3.5 Quad G

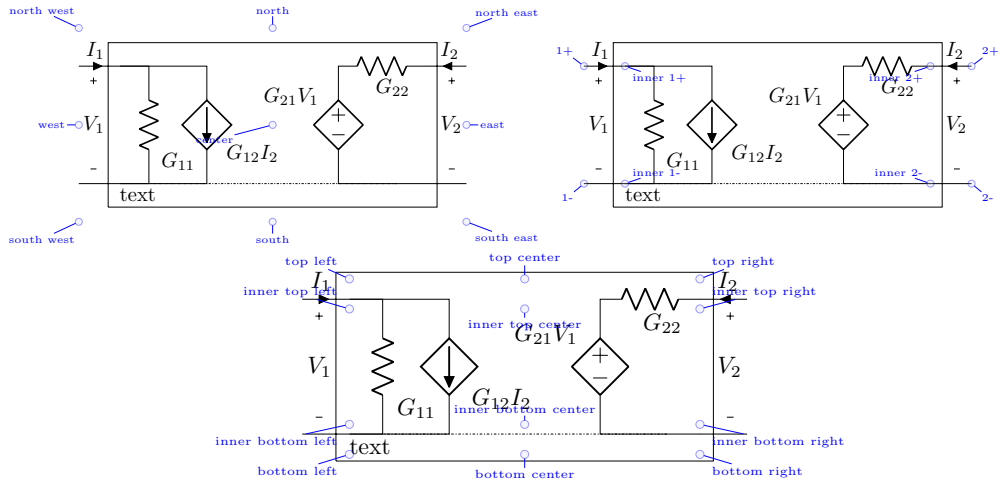

```

1 % Node use
2 node[Quad G]{
3
4 % To path use
5 (A) to[ToQuad G] (B)

```

Besides the base anchors (see 3) it has 4 internal nodes: `<node>-G11`, `<node>-G12`, `<node>-G21` and `<node>-G22` and each of those sub-nodes has geographic anchors as defined at 2.1.

**Note:** There is also a `ToQuad G` to be used in a `to[ ]` path, in which case the key `outer x fit to` style will be triggered with the starting and ending points of the `to[ ]` path.

### 3.5.1 Quad G keys

<i>name</i>	$\langle \text{node-name} \rangle$ , when using a <code>to[]</code> path.
<i>I1</i>	Initial value: $\$I\_1\$$
<i>I2</i>	Initial value: $\$I\_2\$$
<i>V1</i>	Initial value: $\$V\_1\$$
<i>V2</i>	Initial value: $\$V\_2\$$
<i>raw sources</i>	This will suppress the control variables (V1, I2) in the sources' labels
<i>G11</i>	Initial value: $\$G_{\{11\}}\$$
<i>G12</i>	Initial value: $\$G_{\{12\}}\$$
<i>G21</i>	Initial value: $\$G_{\{21\}}\$$
<i>G22</i>	Initial value: $\$G_{\{22\}}\$$
<i>G11 label pos</i>	changes the label position. Defaults to: <code>{south west}{top left}</code>
<i>G12 label pos</i>	changes the label position. Defaults to: <code>{south east}{top left}</code>
<i>G21 label pos</i>	changes the label position. Defaults to: <code>{north west}{bottom right}</code>
<i>G22 label pos</i>	changes the label position. Defaults to: <code>{south east}{top right}</code>

**Note:** The label pos keys expects two anchor names (... label pos= `{\langle anchor A \rangle}{\langle anchor B \rangle}`). The first anchors refers the sub-shape node and the second anchor is the text one.

### 3.6 Quad H

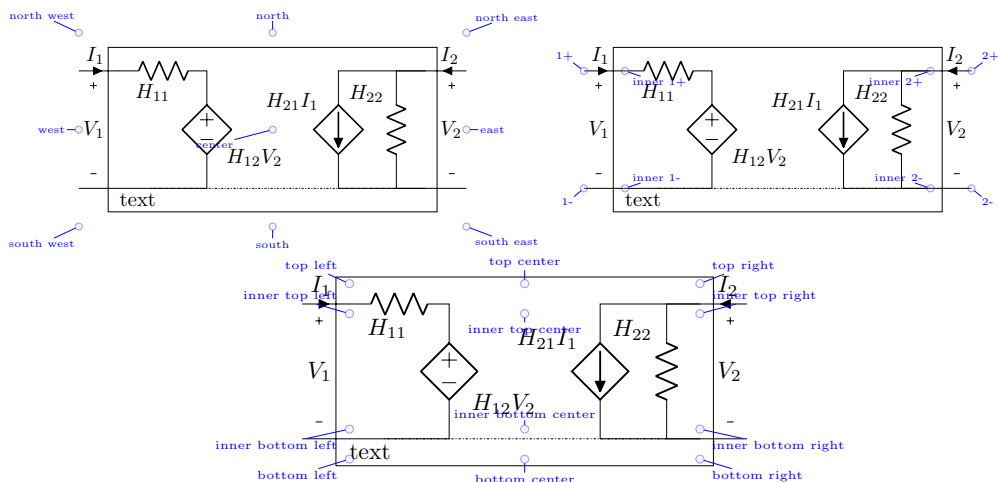

```

1 % Node use
2 node[Quad H] {}
3
4 % To path use
5 (A) to[ToQuad H] (B)

```

Besides the base anchors (see 3) it has 4 internal nodes:  $\langle \text{node} \rangle$ -H11,  $\langle \text{node} \rangle$ -H12,  $\langle \text{node} \rangle$ -H21 and  $\langle \text{node} \rangle$ -H22 and each of those sub-nodes has geographic anchors as defined at 2.1.

**Note:** There is also a `ToQuad H` to be used in a `to[]` path, in which case the key `outer x fit to` style will be triggered with the starting and ending points of the `to[]` path.

### 3.6.1 Quad H keys

<i>name</i>	$\langle$ node-name $\rangle$ , when using a to[] path.
<i>I1</i>	Initial value:\$I_1\$
<i>I2</i>	Initial value:\$I_2\$
<i>V1</i>	Initial value:\$V_1\$
<i>V2</i>	Initial value:\$V_2\$
<i>raw sources</i>	This will suppress the control variables (I1, V2) in the sources' labels
<i>H11</i>	Initial value:\$H_{\{11\}}\$
<i>H12</i>	Initial value:\$H_{\{12\}}\$
<i>H21</i>	Initial value:\$H_{\{21\}}\$
<i>H22</i>	Initial value:\$H_{\{22\}}\$
<i>H11 label pos</i>	changes the label position. Defaults to: {south west}{top left}
<i>H12 label pos</i>	changes the label position. Defaults to: {south east}{top left}
<i>H21 label pos</i>	changes the label position. Defaults to: {north west}{bottom right}
<i>H22 label pos</i>	changes the label position. Defaults to: {north west}{bottom right}

**Note:** The label pos keys expects two anchor names (... label pos= {<anchor A>}{<anchor B>}). The first anchors refers the sub-shape node and the second anchor is the text one.

## 4 Thevenin, Norton single port boxes

### 4.1 The Base Single Port / Black Box Shape

The base shape just draws a base box and sets some connection anchors: 1+, 1-, *inner* 1+, *inner* 1-, besides the geographic and text ones:

#### 4.1.1 Base Keys

These applies to all *Black Box* shapes:

<i>base width</i>	The 'box' width
<i>half base width</i>	Ditto, half width. Initial value:2\pgf@circ@Rlen.
<i>base height</i>	The distance between 1+ and 1-. The 'box' full height is equal to 2*( <i>half base height</i> + <i>height ext</i> + <i>height ext</i> ).
<i>half base height</i>	Ditto, half height. Initial value:\pgf@circ@Rlen/7
<i>height ext</i>	Initial value:2\pgf@circ@Rlen/7
<i>height ext+</i>	Initial value:0
<i>inner ext</i>	distance between the 'box' and inner1+/1-/2+/2-. initial value:\pgf@circ@Rlen/7
<i>outer ext</i>	distance between the 'box' and 1+/1-/2+/2-. initial value: 5\pgf@circ@Rlen/14
<i>inner marks</i>	If set, the inner anchors will be marked.
<i>outer marks</i>	If set, the outer anchors will be marked.
<i>invert</i>	The shape will be inverted, more or less like 'x scale=-1'.
<i>alt, opt</i>	Case a Voltage source is zero, a series impedance will be draw vertically.
<i>outer x fit to</i>	For any Black Box, this is the same as <i>outer x fit to!</i> .
<i>outer x fit to*</i>	<i>outer x fit*=</i> {<CoordA>}{<CoordB>}. The width will be set so that <1+> and <2+> (or <1-> and <2->, depending on the used anchor) <b>will fit</b> <CoordA> and <CoordB>. This might result in a shape rotation.
<i>outer x fit to!</i>	<i>outer x fit!=</i> {<CoordA>}{<CoordB>}. The width will be set so that the distance between <1+> and <2+> (or <1-> and <2->, depending on the used anchor) will be the same as <CoordA> and <CoordB>. This will never result in a shape rotation.

<code>inner x fit to</code>	For any Black Box, this is the same as <code>inner x fit to!</code> .
<code>inner x fit to*</code>	<code>inner x fit*={⟨CoordA⟩}{⟨CoordB⟩}</code> . The width will be set so that <code>⟨inner 1+⟩</code> and <code>⟨inner 2+⟩</code> (or <code>⟨inner 1-⟩</code> and <code>⟨inner 2-⟩</code> , depending on the used anchor) <b>will fit</b> <code>⟨CoordA⟩</code> and <code>⟨CoordB⟩</code> . This might result in a shape rotation.
<code>inner x fit to!</code>	<code>inner x fit!={⟨CoordA⟩}{⟨CoordB⟩}</code> . The width will be set so that the distance between <code>⟨inner 1+⟩</code> and <code>⟨inner 2+⟩</code> (or <code>⟨inner 1-⟩</code> and <code>⟨inner 2-⟩</code> , depending on the used anchor) will be the same as <code>⟨CoordA⟩</code> and <code>⟨CoordB⟩</code> . This will never result in a shape rotation.
<code>y fit to</code>	For any Black Box, this is the same as <code>y fit to*</code> .
<code>y fit to*</code>	<code>y fit*={⟨CoordA⟩}{⟨CoordB⟩}</code> . The height will be set so that <code>1+</code> and <code>1-</code> <b>will fit</b> <code>CoordA</code> and <code>CoordB</code> . This might result in a shape rotation
<code>y fit to!</code>	<code>y fit!={⟨CoordA⟩}{⟨CoordB⟩}</code> . The height will be set so that the distance between <code>⟨1+⟩</code> and <code>⟨1-⟩</code> will be equal to the distance between <code>⟨CoordA⟩</code> and <code>⟨CoordB⟩</code> . This will never result in a shape rotation.
<code>label top left</code>	It will place a label at the top left anchor
<code>label top center</code>	It will place a label at the top center anchor
<code>label top right</code>	It will place a label at the top right anchor
<code>label inner top left</code>	It will place a label at the inner top left anchor
<code>label inner top center</code>	It will place a label at the inner top center anchor
<code>label inner top right</code>	It will place a label at the inner top right anchor
<code>label bottom left</code>	It will place a label at the bottom left anchor
<code>label bottom center</code>	It will place a label at the bottom center anchor
<code>label bottom right</code>	It will place a label at the bottom right anchor
<code>label inner bottom left</code>	It will place a label at the inner bottom left anchor
<code>label inner bottom center</code>	It will place a label at the inner bottom center anchor
<code>label inner bottom right</code>	It will place a label at the inner bottom right anchor

## 4.2 Black Box

```

1 % Node use
2 node[Black Box]{}
3
4 % To path use
5 (A) to[ToBlack Box] (B)

```

This is just the base shape, to be used in cases whereas one just want to emphasises part of a circuit (using, for instance, the `inner x fit to` key, or just mark a single port black box.

**Note:** There is also a `ToBlack Box` to be used in a `to[ ]` path, in which case the key `y fit to` style will be triggered with the starting and ending points of the `to[ ]` path.

### 4.2.1 Black Box keys

<code>name</code>	<code>⟨node-name⟩</code> , when using a <code>to[ ]</code> path.
<code>I1</code>	Initial value: <code>\$I_1\$</code>
<code>V1</code>	Initial value: <code>\$V_1\$</code>

## 4.2.2 Examples of *fit to use*

Squeezing a Black Box between two parts of a circuit (nodes C and D):

```

1 \resizebox{0.4\textwidth}{!}{
2 \begin{tikzpicture}
3   \draw (0,0) \pincoord(ref) to[R=R1] ++(0,2) \pincoord(A) to[R=R2] ++(0,2) \pincoord(B)
4   -- ++(2,0) \pincoord(C,red) (C |- ref) \pincoord(C1) -- (ref);
5   \draw (C) ++(7,0) \pincoord(D,red) -- ++(0.5,0) to[R=R3] ++(0,-3) -- ++(2,0) to[R=R4] ++(0,3) -- ++(0.5,0)
6   \pincoord(E);
7   \draw (C) node[Black Box,anchor=1+,y fit to={C}{C1},outer x fit to={C}{D}]{};
8 \end{tikzpicture}
9 }

```

Fitting some circuit inside the Black Box (nodes C and E):

```

1 \resizebox{0.4\textwidth}{!}{
2 \begin{tikzpicture}
3   \draw (0,0) \pincoord(ref) to[R=R1] ++(0,2) \pincoord(A) to[R=R2] ++(0,2) \pincoord(B)
4   -- ++(2,0) \pincoord(C,red) (C |- ref) \pincoord(C1) -- (ref);
5   \draw (C) ++(7,0) \pincoord(D,red) -- ++(0.5,0) to[R=R3] ++(0,-3) -- ++(2,0) to[R=R4] ++(0,3) -- ++(0.5,0)
6   \pincoord(E);
7   \draw (C) node[Black Box,anchor=inner 1+,y fit to={C}{C1},inner x fit to={C}{E}]{};
8 \end{tikzpicture}
9 }

```

## 4.3 Thevenin

```

1 % Node use
2 node[Thevenin]{}
3
4 % To path use
5 (A) to[ToThevenin] (B)

```

This is the classical Thevenin circuit. Besides the base anchors (see 4.1) it has 2 internal nodes: `<node>-Zth` and `<node>-Vth` and each of those sub-nodes has geographic anchors as defined at 2.1.

**Note:** There is also a `ToThevenin` to be used in a `to[ ]` path, in which case the key `y fit to style` will be triggered with the starting and ending points of the `to[ ]` path.

### 4.3.1 Thevenin keys

<i>name</i>	<code>&lt;node-name&gt;</code> , when using a <code>to[ ]</code> path.
<i>I1</i>	Initial value: $\$I_{1}\$$
<i>V1</i>	Initial value: $\$V_{1}\$$
<i>Zth</i>	Initial value: $\$Z_{th}\$$
<i>Vth</i>	Initial value: $\$V_{th}\$$
<i>Zth label pos</i>	changes the label position. Defaults to: <code>{south west}{top left}</code>

`Vth label pos` changes the label position. Defaults to: {south east}{top left}

**Note:** The label pos keys expects two anchor names (... label pos= {{<anchor A>} {<anchor B>}}). The first anchors refers the sub-shape node and the second anchor is the text one.

## 4.4 Norton

```

1 % Node use
2 node[Norton]{}
3
4 % To path use
5 (A) to[ToNorton] (B)

```

This is the classical Norton circuit. Besides the base anchors (see 4.1) it has 2 internal nodes: `<node>-Yn` and `<node>-In` and each of those sub-nodes has geographic anchors as defined at 2.1.

**Note:** There is also a `ToNorton` to be used in a `to[ ]` path, in which case the key `y fit to` style will be triggered with the starting and ending points of the `to[ ]` path.

### 4.4.1 Norton keys

`name` <node-name>, when using a `to[ ]` path.

`I1` Initial value:  $\$I\_1\$$

`V1` Initial value:  $\$V\_1\$$

`Yn` Initial value:  $\$Y\_N\$$

`In` Initial value:  $\$I\_N\$$

`Yn label pos` changes the label position. Defaults to: {south west}{top left}

`In label pos` changes the label position. Defaults to: {south east}{top left}

**Note:** The label pos keys expects two anchor names (... label pos= {{<anchor A>} {<anchor B>}}). The first anchors refers the sub-shape node and the second anchor is the text one.

## 5 Pseudo-Graph Shape

```

1 % Node use
2 node[PG load line]{}
3
4 node[PG linear load line]

```

Sometimes when representing a single port sub-circuit, one might use a X-Y graph, for which `gnuplot` and `pgfplots` are excellent choices, but a bit overkill if all you want is a crude representation of a linear load line.

This shape is just that, a X-Y graph mockup, that nicely fits inside a black box, and nothing else.

### 5.1 Pseudo-Graph Keys

These are the keys to fine tuning a shape:

`x axis` X axis *name*. Initial value:  $V$

`x val` X axis *val* at the crossing point. Initial value:  $V_{th}$

`y axis` Y axis *name*. Initial value:  $I$

`y val` Y axis *val* at the crossing point. Initial value:  $I_N$

<code>first quadrant</code>	First quadrant mock up. (which is also the default).
<code>second quadrant</code>	Second quadrant mock up.
<code>third quadrant</code>	Third quadrant mock up.
<code>fourth quadrant</code>	Fourth quadrant mock up.
<code>base width</code>	The <i>graph</i> width
<code>half base width</code>	Ditto, half width. Initial value: <code>0.5\pgf@circ@Rlen</code> .
<code>base height</code>	The <i>graph</i> height
<code>half base height</code>	Ditto, half height. Initial value: <code>0.5\pgf@circ@Rlen</code> .

**Note:** Besides these, one can also use the keys presented at 2.2.

## 6 Parallel Connections

Albeit simple, the association of quadripoles in parallel can be tedious if one has to do it many times over in a circuit. That for, an auxiliary, single command, is provided to ease it a bit.

---

`\QuadParConnect` `\QuadParConnect` [`<options>`] {`<Quad-A>`} {`<Quad-B>`}

---

new: 2025/03/07

This will interconnect one side of `<Quad-A>` and `<Quad-B>` *in parallel*. It is assumed that `<Quad-A>` is above `<Quad-B>`. New coordinates, "`c<Quad-Ref> <terminals>`" (note the blank), are created at the *connection terminals*, whereas `<Quad-Ref>` is either `<Quad-A>` (up) or `<Quad-B>` (down), `<terminals>` are the usual `1+` and `1-` (left) or `2+` and `2-` (right).

`<options>` can be any combination of:

<code>left</code>	The parallel connection will be done at the left side (default, assuming, terminals <code>1+</code> and <code>1-</code> )
<code>right</code>	The parallel connection will be done at the right side (default, assuming, terminals <code>2+</code> and <code>2-</code> )
<code>up</code>	The <i>connection terminals</i> will be at the top quadripole.
<code>down</code>	The <i>connection terminals</i> will be at the bottom quadripole.
<code>dots</code>	Dots will be added at the <i>connection terminals</i> .
<code>spacing</code>	To increase/decrease the spacing between the quadripoles terminals and the connection. The default distance being the natural <i>out ext</i> .
<code>swapped sides</code>	If the quadripoles are inverted, and the terminals <code>1+</code> and <code>1-</code> are at the right side.
<code>default sides</code>	That's the default. <code>1+</code> and <code>1-</code> are at the left side.

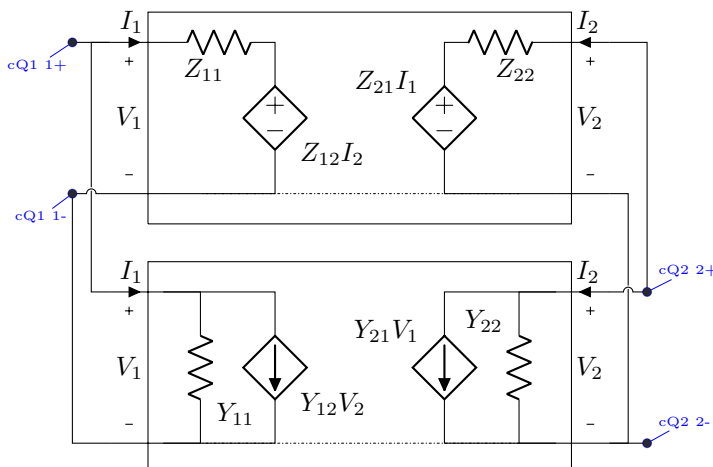

**Note:** It is assumed that the left/right directions are along the X axis, likewise, up/down are along the Y axis.

**Note:** This relies on the `\pathcross` command from the `tikzdotncross` package, which has to be loaded by the user.

```

1 \begin{tikzpicture}
2   \draw (0,0) node[Quad Z, anchor=1+](Q1){}
3     (Q1.south) node[Quad Y, anchor=north](Q2){};
4   \QuadParConnect[left,up,dots]{Q1}{Q2}
5   \QuadParConnect[right,down,dots]{Q1}{Q2}
6 \end{tikzpicture}

```

## 7 Examples of use

First of, a simple case of combining a generic Quad with equations and a generic Black Box with a Pseudo-Graph:

```

1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3   \draw (0,0) \ncoord(ref) node[Quad,anchor=1+](Q1){
4     (Q1.2+) -- ++(1,0) \ncoord(X) -- ++(1,0) node[Black Box,anchor=1+,V1=$V_a$,I1=$I_a$](B1){
5       (Q1.2-) -- (B1.1-)
6       (B1.center) node[PG linear load line,x axis=$V_a$,y axis=$I_a$]{
7         (Q1.center) node{$ \begin{matrix}
8           V_1 & \& 5j * V_2 + 2 * I_2 \\
9           I_1 & \& 3 * V_2 + 2j * I_2
10          \end{matrix} $}
11       } ;
12 \end{tikzpicture}
13 }

```

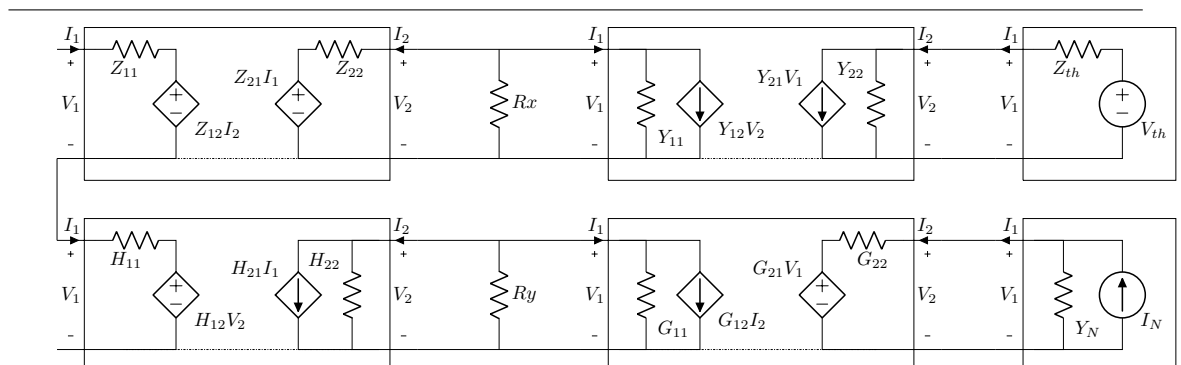

All default Quadripoles and Thevenin/Norton.

```

1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3   \draw (0,0) \ncoord(ref) node[Quad Z,anchor=1+](Qz1){
4     (Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) node[Quad Y,anchor=1+](Qy1){
5       (Qy1.2+) -- ++(1,0) node[Thevenin,anchor=1+](th1){
6         (Qz1.1-) -- ++(0,-1.5) node[Quad H,anchor=1+](Qh1){
7           (Qh1.2+) -- ++(1.5,0) \ncoord(Y) -- ++(1.5,0) node[Quad G,anchor=1+](Qg1){
8             (Qg1.2+) -- ++(1,0) node[Norton,anchor=1+](nr1){
9               (Qz1.2-) -- (Qy1.1-) (Qy1.2-) -- (th1.1-)
10              (Qh1.2-) -- (Qg1.1-) (Qg1.2-) -- (nr1.1-)
11            } ;
12 \draw (X) to[R=$R_x$] (X |- Qz1.2-)
13         (Y) to[R=$R_y$] (Y |- Qh1.2-)
14       ;
15 \end{tikzpicture}
16 }

```

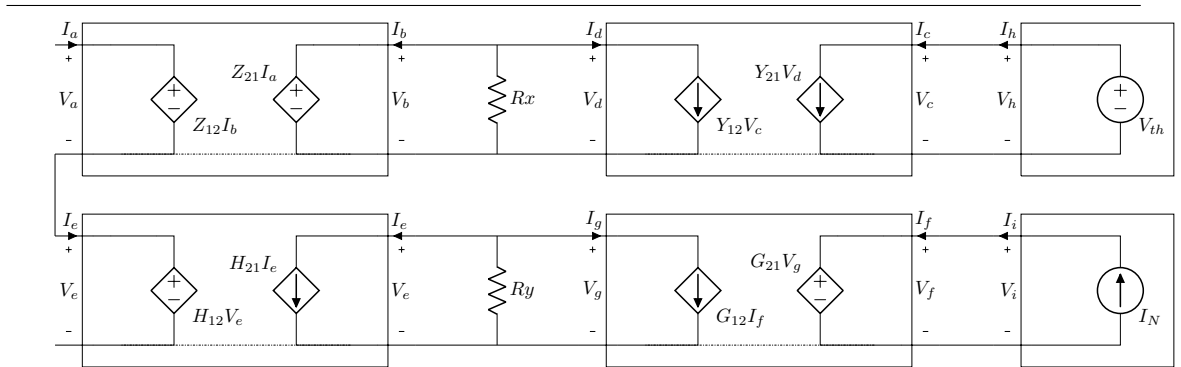

The same demo but with all parameter 11 and 22 zeroed, and changing the “control sources”

```

1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \ncoord(ref) node[Quad Z,anchor=1+,Z11=0,Z22=0,I1=$I_a$,V1=$V_a$,I2=$I_b$,V2=$V_b$] (Qz1){}
4 (Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) node[Quad Y,anchor=1+,Y11=0,Y22=0,I1=$I_d$,V1=$V_d$,I2=$I_c$,V
5 2=$V_c$] (Qy1){}
6 (Qy1.2+) -- ++(1,0) node[Thevenin,anchor=1+,Zth=0,I1=$I_h$,V1=$V_h$] (th1){}
7 (Qz1.1-) -- ++(0,-1.5) node[Quad H,anchor=1+,H11=0,H22=0,I1=$I_e$,V1=$V_e$,I2=$I_e$,V2=$V_e$] (Qh1){}
8 (Qh1.2+) -- ++(1.5,0) \ncoord(Y) -- ++(1.5,0) node[Quad G,anchor=1+,G11=0,G22=0,I1=$I_g$,V1=$V_g$,I2=$I_f$,V
9 2=$V_f$] (Qg1){}
10 (Qg1.2+) -- ++(1,0) node[Norton,anchor=1+,Yn=0,I1=$I_i$,V1=$V_i$] (nr1){}
11 (Qz1.2-) -- (Qy1.1-) (Qy1.2-) -- (th1.1-)
12 (Qh1.2-) -- (Qg1.1-) (Qg1.2-) -- (nr1.1-)
13 ;
14 \draw (X) to[R=$R_x$] (X |- Qz1.2-)
15 (Y) to[R=$R_y$] (Y |- Qh1.2-)
16 ;
17 \end{tikzpicture}
18 }

```

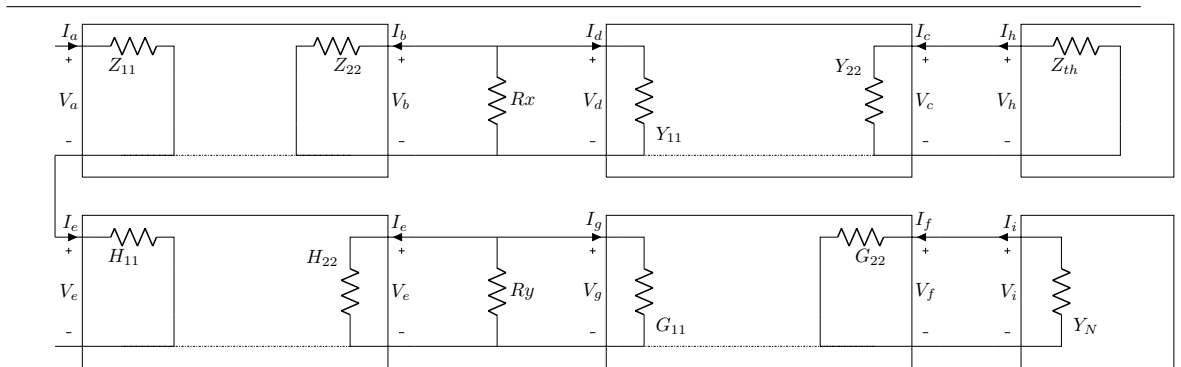

Now with the 12 and 21 parameters zeroed, normal form:

```

1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \ncoord(ref) node[Quad Z,anchor=1+,Z12=0,Z21=0,I1=$I_a$,V1=$V_a$,I2=$I_b$,V2=$V_b$] (Qz1){}
4 (Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) node[Quad Y,anchor=1+,Y12=0,Y21=0,I1=$I_d$,V1=$V_d$,I2=$I_c$,V
5 2=$V_c$] (Qy1){}
6 (Qy1.2+) -- ++(1,0) node[Thevenin,anchor=1+,Vth=0,I1=$I_h$,V1=$V_h$] (th1){}
7 (Qz1.1-) -- ++(0,-1.5) node[Quad H,anchor=1+,H12=0,H21=0,I1=$I_e$,V1=$V_e$,I2=$I_e$,V2=$V_e$] (Qh1){}
8 (Qh1.2+) -- ++(1.5,0) \ncoord(Y) -- ++(1.5,0) node[Quad G,anchor=1+,G12=0,G21=0,I1=$I_g$,V1=$V_g$,I2=$I_f$,V
9 2=$V_f$] (Qg1){}
10 (Qg1.2+) -- ++(1,0) node[Norton,anchor=1+,In=0,I1=$I_i$,V1=$V_i$] (nr1){}
11 (Qz1.2-) -- (Qy1.1-) (Qy1.2-) -- (th1.1-)
12 (Qh1.2-) -- (Qg1.1-) (Qg1.2-) -- (nr1.1-)
13 ;
14 \draw (X) to[R=$R_x$] (X |- Qz1.2-)
15 (Y) to[R=$R_y$] (Y |- Qh1.2-)
16 ;
17 \end{tikzpicture}
18 }

```

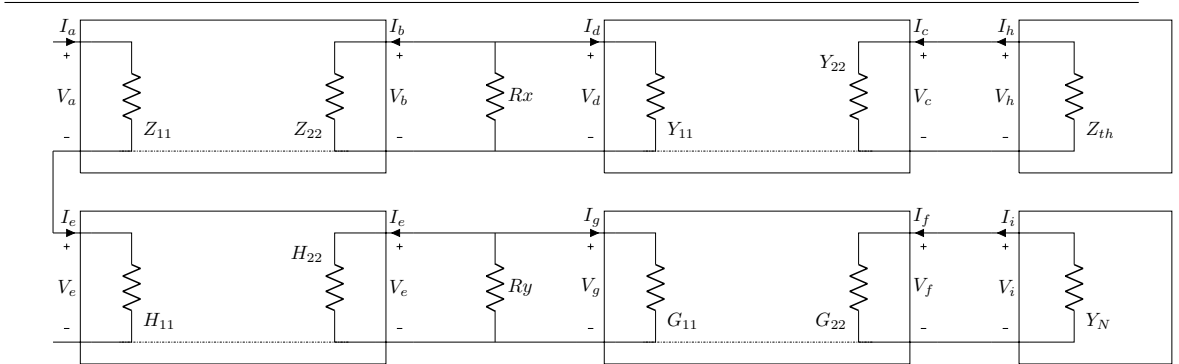

Same as last one, but with an alternate form:

```

1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \ncoord(ref) node[Quad Z,anchor=1+,Z12=0,Z21=0,I1=$I_a$,V1=$V_a$,I2=$I_b$,V2=$V_b$] (Qz1){}
4 (Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) node[Quad Y,anchor=1+,Y12=0,Y21=0,I1=$I_d$,V1=$V_d$,I2=$I_c$,V
5 2=$V_c$] (Qy1){}
6 (Qy1.2+) -- ++(1,0) node[Thevenin,anchor=1+,Vth=0,I1=$I_h$,V1=$V_h$] (th1){}
7 (Qz1.1-) -- ++(0,-1.5) node[Quad H,anchor=1+,H12=0,H21=0,I1=$I_e$,V1=$V_e$,I2=$I_e$,V2=$V_e$] (Qh1){}
8 (Qh1.2+) -- ++(1.5,0) \ncoord(Y) -- ++(1.5,0) node[Quad G,anchor=1+,G12=0,G21=0,I1=$I_g$,V1=$V_g$,I2=$I_f$,V
9 2=$V_f$] (Qg1){}
10 (Qg1.2+) -- ++(1,0) node[Norton,anchor=1+,In=0,I1=$I_i$,V1=$V_i$] (nr1){}
11 (Qz1.2-) -- (Qy1.1-) (Qy1.2-) -- (th1.1-)
12 (Qh1.2-) -- (Qg1.1-) (Qg1.2-) -- (nr1.1-)
13 ;
14 \draw (X) to[R=$R_x$] (X |- Qz1.2-)
15 (Y) to[R=$R_y$] (Y |- Qh1.2-)
16 ;
17 \end{tikzpicture}
18 }

```

Setting all parameters, some impedances as zig-zag, others as generic, per quadripole:

```

1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \ncoord(ref) node[Quad Z,alt,round sources,european,anchor=1+,Z11=$Z_a$,Z22=$Z_b$,Z12=$Z_{re}$,Z21=$
4 Z_{fe}$,I1=$I_a$,V1=$V_a$,I2=$I_b$,V2=$V_b$] (Qz1){}
5 (Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) node[Quad Y,alt,anchor=1+,Y11=$Y_a$,Y22=$Y_b$,Y12=$Y_{re}$,Y21=$
6 Y_{fe}$,I1=$I_d$,V1=$V_d$,I2=$I_c$,V2=$V_c$] (Qy1){}
7 (Qy1.2+) -- ++(1,0) node[Thevenin,alt,anchor=1+,Vth=$V_1$,Zth=$Z_a$,I1=$I_h$,V1=$V_h$] (th1){}
8 (Qz1.1-) -- ++(0,-1.5) node[Quad H,european,alt,anchor=1+,H11=$H_a$,H22=$H_b$,H12=$H_{re}$,H21=$H_{fe}$,I1=$I_
9 e$,V1=$V_e$,I2=$I_e$,V2=$V_e$] (Qh1){}
10 (Qh1.2+) -- ++(1.5,0) \ncoord(Y) -- ++(1.5,0) node[Quad G,alt,european,alt,anchor=1+,G11=$G_a$,G22=$G_b$,G12=$G_{re}$,G21=$
11 G_{fe}$,I1=$I_g$,V1=$V_g$,I2=$I_f$,V2=$V_f$] (Qg1){}
12 (Qg1.2+) -- ++(1,0) node[Norton,alt,control sources,european,anchor=1+,In=$I_b$,Yn=$Y_b$,I1=$I_i$,V1=$V_i$] (nr
13 1){}
14 (Qz1.2-) -- (Qy1.1-) (Qy1.2-) -- (th1.1-)
15 (Qh1.2-) -- (Qg1.1-) (Qg1.2-) -- (nr1.1-)
16 ;
17 \draw (X) to[R=$R_x$] (X |- Qz1.2-)
18 (Y) to[R=$R_y$] (Y |- Qh1.2-)
19 ;
20 \end{tikzpicture}
21 }

```
