

The `ryethesis` class^{*}

Jason V. Lassaline
`jvl@ryerson.ca`

May 9, 2014

1 Introduction

This class provides a document formatted to the Ryerson University School of Graduate Studies policy on Thesis Requirements, as published at the Ryerson SGS policy Web site. This class includes formatting for dissertations and reports (e.g. MEng reports), handles the formatting of all required front and back matter, and defines a number of commands for specifying content. Page numbering as per Ryerson SGS requirements is handled automatically as is the ordering of information. Some content (e.g. author declaration) are inserted automatically. Other commands (e.g. `\dedication`) are provided to define optional information. The intent of this class is to allow Ryerson students to focus on the content of the thesis or dissertation and have `LATEX` handle the minutia of formatting to SGS requirements. If you are aware of any deficiencies or errors, please contact the author or submit your own patches.

This class file is largely built upon the existing `book` class and thus inherits many options (e.g. `oneside`, `twoside`) from this class. There are some specifications in Ryerson's thesis formatting regulations that differ from typical `LATEX` formatting (e.g. Appendices appear in a separate List of Appendices instead of within the Table of Contents). To better control the order in which content appears, the user should make use of the commands described in Section 2 to specify content (e.g. `\abstract` and `\appendix` commands). This deviates somewhat from typical `LATEX` usage where the author specifies front, main and back matter manually in the order in which they wish the material to appear.

2 Usage

Several macros are available for defining the various content within the thesis, dissertation or report. Please refer to the included sample, `ryesample.tex`, for additional examples of usage. In writing the thesis you should focus on inserting the main matter of the document within the `document` environment. Front and back

^{*}This document corresponds to `ryethesis` v1.36, dated 2014/05/09.

matter content, such as the abstract and appendices should be defined using the respective commands listed below. Most of the following macros should be called in the preamble of the document (i.e. before the `\begin{document}` environment), with exceptions noted below.

`\title` This macro is used to define the title of the work, as in the base L^AT_EX classes. This title will appear on the title page and abstract page. Capitalize your title as normal. The title on the title page will be typeset using small caps.

`\title {\langle Your Document Title \rangle}`

`\author` Your full name as it will appear on the title and abstract page. The usage is the same as with the `book` and other classes.

`\author {\langle Your Name \rangle}`

`\degreeName` The full name of your degree (e.g. Doctor of Philosophy, Masters of Applied Science). Do not use abbreviations.

`\degreeName {\langle Full Degree Name \rangle}`

`\degreeYear` The year that the degree will be awarded, typically the year of convocation.

`\degreeYear {\langle Year of Convocation \rangle}`

`\program` The name of the graduate program (e.g. Aerospace Engineering).

`\program {\langle Program Name \rangle}`

`\prevDegreeA` The full name, location and year of any previous completed degrees, starting with the most recent (`\prevDegreeA`) through to the oldest (`\prevDegreeD`). Currently only a maximum of four previous degrees are implemented. The arguments to each `\prevDegree?` command is the same.

`\prevDegreeA{\langle Full Degree Name \rangle}{\langle University \rangle}{\langle Year of Degree \rangle}`

`\partnerUniversity` The name of any partner University or school affiliated with the granting of this degree. As Ryerson has a full-fledged graduate program this command is optional and likely rarely used.

`\partnerUniversity{\langle University Name \rangle}`

`\abstract` This macro defines the content of the abstract which should abide by SGS policy. Do not use equations and avoid symbols if possible. The header of the abstract will be formatted automatically using the content defined by the previous commands. The current Ryerson word limit on abstracts is 350 words for a PhD thesis, 150 words otherwise. If no abstract is defined a message regarding “Abstract goes here” will appear within your document. An abstract is mandatory for the final version of your thesis.

`\abstract{\langle The summary of your document, abiding by the word limit rules \rangle}`

<code>\acknowledgements</code>	The acknowledgements and dedication sections are optional, but can be defined using these commands.
	<code>\acknowledgements{\langle Any person(s) whose work or help you wish to acknowledge\rangle}</code>
	<code>\dedication{\langle Anyone to whom you wish to dedicate this work\rangle}</code>
<code>\addtoreferences</code>	As this class tightly controls the order of appearance of content within the document, it is necessary to provide a command for specifying BIBTEX input files. For each .bib file you wish to use, use a <code>\addtoreferences</code> command before the end of the <code>document</code> environment. Do not use the <code>\bibliography</code> command directly within the document. You do not need to specify the .bib extension to the filename. You should also use the <code>\bibliographystyle</code> command in your preamble to define the formatting style of your reference list. You'll need to process your document source with BIBTEX as normal.
	<code>\addtoreferences{\langle .bib file name\rangle}</code>
<code>\usebibliography</code>	The default header for the list of references is “References”. Some document styles prefer the header read “Bibliography” or “End Notes”. Use the commands <code>\usereferences</code> , <code>\usebibliography</code> , or <code>\useendnotes</code> anywhere before the end of the <code>document</code> environment.
<code>\usereferences</code>	
<code>\useendnotes</code>	
<code>\appendix</code>	The book class <code>\appendix</code> command has been redefined to take an argument to specify the appendices. Use the <code>\chapter</code> , <code>\section</code> , etc commands as normal within the argument to <code>\appendix</code> as normal to create each appendix and subsections. You can call this command in the preamble or anywhere before closing the document with the <code>\end{document}</code> .
	<code>\appendix{\langle All sectioned content for the appendix.\rangle}</code>

3 Class Options

There are a number of class options defined in addition to the default `book` class options. The default option `10pt` is applied but you can override this option using the `11pt` or `12pt` command, which is acceptable according to the current SGS policy. Most options appear in pairs which turn on or off various features. Most are complemented by a corresponding macro which can be used in the document preamble. These options and macros are described below, grouped by function. Options are indicated in the margin as default and opposite pairs as *default/option*.

final/draft Switch between a final and draft versions of the document. Draft versions do not include some content (e.g. declaration) and figures, if using the `graphics`

package, will likely be marked using placeholders. The `draft` option will enable the `oneside` option, while the `final` option will enable the `twoside` option. Override this if you wish.

```
lof/nolof
\includelistoffigures
  \nolistoffigures
nolop/lop
\includelistofplates
  \nolistofplates
```

Include a List of Figures. This list is generated by the use of `figure` floats as normally used in L^AT_EX.

The use of plates (as opposed to figures or illustrations) is optional. If a List of Plates is requested, a new float environment `plate` is defined. Behaviour is similar to another float environment.

```
noloi/loi
\includelistoffillustrations
  \nolistoffillustrations
```

The SGS formatting requirements specify the option of a List of Illustrations, although a List of Figures will likely suffice. A new `illustration` float environment is declared if this option is enabled.

```
lot/nolot
\includelistoftables
  \nolistoftables
los/nolos
\includenomenclature
  \nonomenclature
```

A List of Tables is generated based upon the use of the `table` environment. As tables are commonly used in theses, this option is enabled by default.

A List of Symbols is generated using the `nomenclature` package. As the SGS policy makes no reference to requirements for a nomenclature list, this list is inserted as the last item in the front matter. Nomenclatures are commonly used in math, science, and engineering theses. See the `nomenclature` package for available commands, but note that there is no need to issue the `\printnomenclature` command as it is handled automatically. You will need to do additional processing using the `makeindex` command.

```
loa/noloa
\includelistofappendices
  \nolistofappendices
```

Typically, most documents which include an appendix list the appendices within the Table of Contents. SGS formatting policy indicates a separate List of Appendices. This switch is enabled by default, and any `\chapter` or lower sectioning will appear in a separate List of Appendices. You must use the `\appendix` command for the appendices to be numbered and inserted correctly. No List of Appendices will appear if you do not use the `\appendix` command.

```
glossary/noglossary
\includeglossary
  \noglossary
```

Glossaries are supported using the `glossaries` package but are optional. You will need to do additional processing using the `makerglossaries` command to generate the glossary content. See the `glossaries` package for more details. Include glossary commands for identifying glossary items but do not issue the `\printglossary` command as this is handled automatically if glossaries are enabled. Acronyms can be defined in the glossary using the `\newacronym` command and will be listed separately within the glossary.

```
index/noindex
\includeindex
  \noindex
```

An optional index is supported using the `makeindex` command in the normal fashion. Indicate index items using the `\index` command but do not issue the `\printindex` command as this is handled automatically if indices enabled.

4 Implementation

*This information is provided to document the source code of this class definition.
It can be safely ignored by the casual user.*

This class is derived from the book class, with a number of commands used to define the various sections of the document. The class is responsible for inserting the content in the correct order according to SGS policy. Thus the focus of this class is to provide a set of commands for defining the content of the sections, rather than provide environments which delimit the sections and expecting the user to use them in the correct order.

The class definition begins with the following package requirements.

```
1 % A minimal set of packages as required by the class
2 \RequirePackage{ifthen}
3 \RequirePackage{fancyhdr}
4 \RequirePackage{setspace}
5 % If using pdfpages, note that it does not appear to play
6 % well with vmargin and XeTeX (inserted pdfs are not
7 % anchored in the correct location).
8 \RequirePackage{vmargin}
```

The class defines a number of options for enabling and disabling certain features. Note that SGS policy requires a separate List of Appendices instead of including appendices within the Table of Contents. No requirement for nomenclature is specified, thus a List of Symbols is inserted after all other lists.

```
9 % The following commands are based upon SGS policy effective Sept. 2009
10 % Class options:
11 % Font size must 10 to 12 pt. Default will be 10pt, aka '10pt' option
12 %   Alternate options: '11pt','12pt'
13 %
14 % Papersize must be US letter size (8.5"x11"), ie always 'letterpaper' option
15 %
16 % Booleans for option switches, with default states below.
17 % These switches are modifiable by options to the class
18 % and by toggle commands
19 %
20 \newboolean{@ryedraft} \setboolean{@ryedraft}{false} % not draft == final
21 \newboolean{@ryelistoftables} \setboolean{@ryelistoftables}{true}
22 %
23 % The distinction between plates, illustrations and figures is subtle.
24 % SGS policy indicates separate lists for each. Only LoF is enabled by default.
25 %
26 \newboolean{@ryelistofplates} \setboolean{@ryelistofplates}{false}
27 \newboolean{@ryelistoffigures} \setboolean{@ryelistoffigures}{true}
28 \newboolean{@ryelistofillustrations} \setboolean{@ryelistofillustrations}{false}
29 %
30 % Ryerson SGS policy specifies that appendices should be listed
31 % in a separate list, and not within the ToC.
32 %
```

```

33 \newboolean{@ryelistofappendices} \setboolean{@ryelistofappendices}{true}
34 % As the List of Appendices overrides the |\addtocontents| command,
35 % hyperef is included by this class to avoid broken links when
36 % including the table of contents or list of appendices.
37 \newboolean{@ryehyperref} \setboolean{@ryehyperref}{true}
38 %
39 % Ryerson SGS policy does not specify anything about a list of
40 % symbols or nomenclature, however in engineering, math, and
41 % science, this is a common front matter feature. A List of Symbols
42 % is inserted after all the previous lists and toc.
43 %
44 \newboolean{@ryenomenclature} \setboolean{@ryenomenclature}{false}
45 % Glossaries and indices require extra processing. These are disabled by default as they are li
46 \newboolean{@ryeglossary} \setboolean{@ryeglossary}{false}

206
207 % Load the base book document class.
208 \LoadClass{book}

```

Page size and margin as specified in the SGS policy, using the `vmargin` package.

```

209
210 % Always use 8.5"x11" paper.
211 \setpapersize{USletter}
212 % Set left, top, right, bottom margins
213 % An extra 0.25in added to left margin (right margin on even pages) to allow for binding.
214 \setmargrb{1.25in}{1in}{1in}{1in}

```

The book class commands `\frontmatter`, `\mainmatter`, and `\backmatter` are redefined, based upon SGS policy effective Sept. 2009. Each use the following page styles:

Front matter roman page numbering, plain page style (page number only)

Main matter arabic page numbering, fancy headers with alternating chapter and section

Back matter no format specified so keeping same style as main matter

`\cleardoublepage` Create a new page, set page style to empty (no footer or header), then issue a clear page if in `twoside` mode. Used before every ToC, list, or start of new chapter. This results in part (e.g. Table of Contents) starting on the right hand side (odd page number) in `twoside` mode.

```

215 % based upon clearemptydoublepage from page 92 of
216 % The LaTeX Companion, 1993.
217 \renewcommand{\cleardoublepage}{\newpage{\pagestyle{empty}%
218 \clearpage\if@twoside \ifodd\c@page\else%
219 \hbox{}\newpage\if@twocolumn\hbox{}\newpage\fi\fi\fi}
220 % An internal clearpage command
221 \newcommand{\ryethesis@clearpage}{%
222 {\if@openright\cleardoublepage\else\clearpage\fi}

\frontmatter Inserts all front matter content. This function is called by the class at the beginning of the document and does not need to be called by the user.
223 \newif\if@ryethesisismatchtoc \@ryethesisismatchtocfalse
224 \renewcommand\frontmatter{%
225   \@mainmatterfalse
226   \@ryethesisismatchtocfalse
227   \pagenumbering{roman}
228   \pagestyle{plain}
229   \maketitle
230   \ryethesis@insertdeclaration
231   \ryethesis@insertabstract
232   \ryethesis@insertacknowledgements
233   \ryethesis@insertdedication
234   \ryethesis@inserttoc

```

\addtoreferences As the position of bibliographic data is now more tightly controlled, it is necessary to provide the user with a command for specifying the bib input files. Each call to **\addtoreferences** will append another bib input file to the list of files to load. The user can specify the bibliography style in the document preamble as is normal.

```
580 \newcommand{\addtoreferences}[1]{%
```

```
581 \ifx\empty\ryethesis@listofbibfiles\edef\ryethesis@listofbibfiles{\#1}\else\edef\ryethesis@listo  
582 }
```

\usebibliography These commands provide the user with an easy way of altering the heading of the
\usereferences bibliographic data.

```
583 \newcommand{\usebibliography}{\renewcommand{\bibname}{Bibliography}}  
584 \newcommand{\usereferences}{\renewcommand{\bibname}{References}}  
585 \newcommand{\useendnotes}{\renewcommand{\bibname}{End Notes}}
```

Final commands to issue at the end of the class. In the case of draft mode, the line spacing is set to double spacing. In final mode, a line spacing of 1.5 is used, as required by SGS. The **\usereferences** command is used to label the bibliographic section as “References” by default.

```
586  
587 \AtEndOfClass{  
588 \ifthenelse{\boolean{@ryedraft}}{  
589 { % Draft mode uses double spacing  
590 \doublespacing}  
591 { % Final mode uses 1.5 spacing as specified in SGS policy Sept. 2009.  
592 \onehalfspacing}  
593 \usereferences  
594  
595  
596 }
```

The **\AtBeginDocument** and **\AtEndDocument** are used to insert the front, main, and back matter in the correct place for the user. This tightly controls the order of appearance of each type of content. Note that the **\addcontents** command is redefined here to redirect List of Appendices entries into a separate file if so desired.

```
597 % Insert front matter & mainmatter settings before user's material
