

# The shadowtext package

Version 0.3

Y. Zwols (yz2198@columbia.edu)

May 18, 2012

## 1 Usage

The shadowtext package introduces a new command, namely the `\shadowtext` command. This is a box that adds a shadow behind text. Its usage is simple. The following code and its output illustrates the usage.

```
\shadowtext{This is a shadowtext}      This is a shadowtext
```

## 2 Changing the position of the shadow

The position of the shadow consists of two components: a horizontal offset and a vertical offset. The package offers two ways of changing the position of the shadow. The first and easiest way of changing the position is by using the `\setshadowoffset` command. This command sets the horizontal and vertical offset simultaneously. For example:

```
\shadowoffset{2pt}                  This is a shadowtext  
\shadowtext{This is a shadowtext}
```

Alternatively, one may use the commands `shadowoffsetx` and `shadowoffsety` to independently change the horizontal and vertical offset. For example:

```
\shadowoffsetx{1pt}                This is a shadow text  
\shadowoffsety{4pt}  
\shadowtext{This is a shadow text}
```

### 3 Changing the color of the shadow

The color of the shadow may be changed by using the `shadowcolor` and `shadowrgb` commands.<sup>1</sup> The `shadowcolor` command takes as an argument the name of a color, whereas `shadowrgb` takes a comma-separated list of red, green, blue values. For example, the following code adds a blueish shadow using `\shadowcolor`:

```
\shadowoffset{2pt}                                This is a shadow text  
\shadowcolor{blue!40!white}  
\shadowtext{This is a shadow text}
```

The following code produces a red shadow using `\shadowrgb`:

```
\shadowoffset{2pt}                                This is a shadow text  
\shadowrgb{1.0, 0.5, 0.5}  
\shadowtext{This is a shadow text}
```

### 4 More examples

The following code illustrates how to use `shadowtext` in more interesting settings:

```
\definecolor{navy}{rgb}{0,0,0.5}                Large!  
\shadowrgb{0.8, 0.8, 1}  
\shadowoffset{1pt}  
\shadowtext{  
    \color{navy}  
    \fontsize{16}{16}\selectfont  
    Large!}  
  
\shadowoffset{1pt}                                1 2  
\color{black}                                     3 4  
\shadowtext{  
    \begin{tabular}{|l|l|}  
    \hline  
    1 & 2 \\\hline  
    3 & 4 \\\hline  
    \end{tabular}  
}  
  
\shadowoffset{1pt}                                 $\sqrt{2\pi}e^{-n}$   
\shadowtext{$\sqrt{2\pi}e^{-n}$}
```

---

<sup>1</sup>Internally, the package uses the `\color` command from the `color` package to set its color

```
\shadowoffset{2pt}
\shadowtext{
    \color{navy}%
    \fontencoding{T1}%
    \fontfamily{pag}%
    \fontseries{b}%
    \fontsize{32}{32}%
    \selectfont%
Section \color{red}\arabic{section}%
```
